"Complete sequence of the 24-mer hemocyanin of the tarantula Eurypelma californicum. Structure and intramolecular evolution of the
                                                                                                 ATHOROGOMES

-1- SUBUNIT: SCORPION HEMOCYANIN IS A 24-CHAIN POLYMER WITH 8

DIFFERENT CHAINS IDENTIFIED, ASSEMBLED IN HEXAMERIC SUBSTRUCTURES.
-1- SUBCELLULAR LOCATION: Extracellular.
-1- TISSUB SPECIFICITY: Hemolymph.
-1- PTM: THREE DISULFIDE BONDS ARE PRESENT.
-1- MASS SPECIFICAMERY: MW=71890; MW ERR=7; METHOD=Electrospray.
-1- MISCELLANDOUS: THE TWO COPPER IONS BOUND BACH HAVE 3 NITROGEN LIGAND (POSSIBLY CONTRIBUTED BY HIS RESIDUES) AND SHARE A BRIDGING LIGAND (POSSIBLY CONTRIBUTED BY A TYR RESIDUE) IN ADDITION TO BINDING OXYGEN.
-1- SIMILARITY: BELONGS TO THE TYROSINASE FAMILY. HEMOCYANIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

-!- FUNCTION: HEMOCYANINS ARE COPPER-CONTAINING OXYGEN CARRIERS OCCURRING FREELY DISSOLVED IN THE HEMOLYMPH OF MANY MOLLUSKS AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBGLIANT TARANTULA HEMOCYANIN IS A 24-CHAIN POLYMER WITH SEVEN DIFFERENT CHAINS IDENTIFIED.

BUBCELLULAR LOCATION: Extracellular.

ISSUE SPECIFICITY: Hemolymph.

MISCELLANGOUS: THE TWO COPPER IONS BOUND EACH HAVE 3 NITROGEN LIGANDS (PRESUMABLY CONTRIBUTED BY HIS RESIDUES) AND SHARE A BRIDGING LIGAND (POSSIBLY CONTRIBUTED BY A TYR RESIDUE) IN ADDITION TO BINDING OXYGEN.

SIMILARITY: BELONGS TO THE TYROSINASE FAMILY. HEMOCYANIN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -:- SIMILARITY: Contains 2 RNA recognition motif (RRM) domains.
-:- SIMILARITY: BELOWGS TO THE SR FAMILY OF SPLICING FACTORS.
-:- CAUTION: Ref.2 sequence differs from that shown due to erroneous gene model prediction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -1- SUBCELLULAR LOCATION: Nuclear (Potential).
-1- TISSUE SPECIFICITY: Highly expressed in roots and flowers. A presumably longer alternatively spliced form is found in leaves, stems and flowers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRAIN=CV. -!- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-!- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

IT BINDS TO THE SEXE RESPONSE ELEMENT (5'-ACCINNININGGT-3') PRESENT

IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN ETTHER

ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION

WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS

BY STERICALLY HINDERING THE ASSENBLY OF THE TRANSCRIPTION

INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                         -!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Highly expressed in roots and flowers. A presumably longer alternatively spliced form is found in leaves.
               -!- FUNCTION: REQUIRED FOR CONSTITUTIVE AND ALTERNATIVE PRE-MRNA SPLICING (BY SIMILARITY).
                                                                                                                                                                                        -!- SIMILARITY: Contains 2 RNA recognition motif (RRM) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .<u>.</u>
